# Agenda

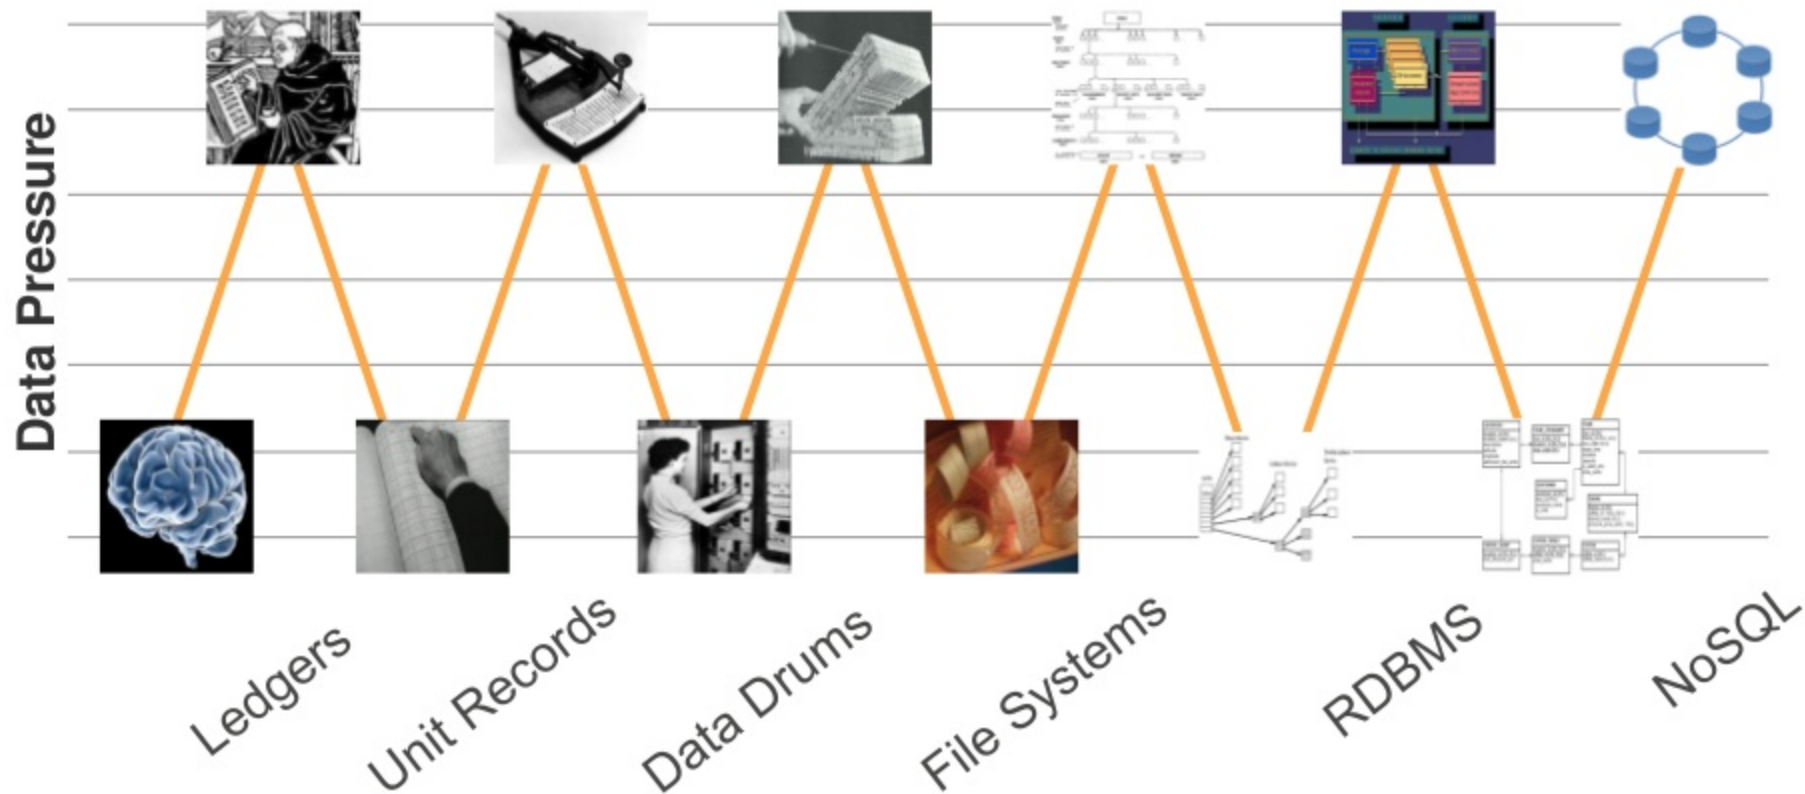

- Brief history of data processing
- Relational (SQL) vs. nonrelational (NoSQL)
- Fully managed features of DynamoDB
- Customer use cases
- Demo – serverless applications
- Pricing and Free Tier

# Data volume since 2010

- 90% of stored data generated in last 2 years
- 1 terabyte of data in 2010 equals 6.5 petabytes today
- Linear correlation between data pressure and technical innovation
- No reason these trends will not continue over time

# Timeline of database technology

# Technology adoption and the hype curve

# **Relational (SQL) vs. nonrelational (NoSQL)**

# SQL vs. NoSQL schema design

# Why NoSQL?

SQL

NoSQL

Optimized for storage	Optimized for compute
Normalized/relational	Denormalized/hierarchical
Ad hoc queries	Instantiated views
Scale vertically	Scale horizontally
Good for OLAP	Built for OLTP at scale

### ABSTRACT

Reliability at massive scale is one of the biggest challenges we face at Amazon.com, one of the largest e-commerce operations in the world; even the slightest outage has significant financial consequences and impacts customer trust. The Amazon.com platform, which provides services for many web sites worldwide, is implemented on top of an infrastructure of tens of thousands of servers and network components located in many datacenters around the world. At this scale, small and large components fail continuously and the way persistent state is managed in the face of these failures drives the reliability and scalability of the software systems.

This paper presents the design and implementation of Dynamo, a highly available key-value storage system that some of Amazon's core services use to provide an "always-on" experience. To achieve this level of availability, Dynamo sacrifices consistency under certain failure scenarios. It makes extensive use of object versioning and application-assisted conflict resolution in a manner that provides a novel interface for developers to use.

One of the lessons our organization has learned from operating Amazon's platform is that the reliability and scalability of a system is dependent on how its application state is managed. Amazon uses a highly decentralized, loosely coupled, service oriented architecture consisting of hundreds of services. In this environment there is a particular need for storage technologies that are always available. For example, customers should be able to view and add items to their shopping cart even if disks are failing, network routes are flapping, or data centers are being destroyed by tornadoes. Therefore, the service responsible for managing shopping carts requires that it can always write to and read from its data store, and that its data needs to be available across multiple data centers.

Dealing with failures in an infrastructure composed of millions of components in our standard mode of operation; there are always a small but significant number of server and network components that are failing at any given time. As such Amazon's software systems need to be constructed in a manner that treats failure handling as the normal case without impacting availability or performance.

# Major League Baseball Fields Big Data, Excitement with Amazon DynamoDB

“

For the first time, we can measure things we've never been able to measure before.

**Joe Inzerillo**

Executive Vice President and CTO, MLBAM

”

- MLBAM can scale to support many games on a single day.
- Amazon DynamoDB powers queries and supports the fast data retrieval required.
- MLBAM distributes 25,000 live events annually and 10 million streams daily.

MLBAM (MLB Advanced Media) is a full service solutions provider, operating a powerful content delivery platform.

# Redfin Is Revolutionizing Home Buying and Selling with Amazon DynamoDB

We have billions of records on DynamoDB being refreshed daily or hourly or even by seconds.

**Yong Huang**  
Director, Big Data Analytics, Redfin

**REDFIN.**

- Redfin provides property and agent details and ratings through its websites and apps.
- With DynamoDB, latency for “similar” properties improved from 2 seconds to just 12 milliseconds.
- Redfin stores and processes five billion items in DynamoDB.

Redfin is a full-service real estate company with local agents and online tools to help people buy & sell homes.

# Expedia's Real-time Analytics Application Uses Amazon DynamoDB

“

With DynamoDB we were up and running in a less than day, and there is no need for a team to maintain.

**Kuldeep Chowhan**  
Principal Engineer, Expedia

”

- Expedia's real-time analytics application collects data for its "test & learn" experiments on Expedia sites.
- The analytics application processes ~200 million messages daily.
- Ease of setup, monitoring, and scaling were key factors in choosing Amazon DynamoDB.

Expedia is a leader in the \$1 trillion travel industry, with an extensive portfolio that includes some of the world's most trusted travel brands.

# Nexon Scales Mobile Gaming with Amazon DynamoDB

“

By using AWS, we decreased our initial investment costs, and only pay for what we use.

Chunghoon Ryu  
Department Manager, Nexon

”

- Nexon used Amazon DynamoDB as its primary game database for a new blockbuster mobile game, HIT
- HIT became the #1 Mobile Game in Korea within the first day of launch and has > 2M registered users
- Nexon's HIT leverages DynamoDB to deliver steady latency of less than 10ms to deliver a fantastic mobile gaming experience for 170,000 concurrent players

Nexon is a leading South Korean video game developer and a pioneer in the world of interactive entertainment.

**That sounds really good. How do I get started?**

**Let's create a table..**

## Create DynamoDB table

☐ Add sort key

### Table settings

Default settings provide the fastest way to get started with your table. You can modify these default settings now or after your table has been created.

☒ Use default settings

- No secondary indexes
- Provisioned capacity set to 5 reads and 5 writes.
- Basic alarms with 80% upper threshold using SNS topic "dynamodb".

Additional charges may apply if you exceed the AWS Free Tier levels for CloudWatch or Simple Notification Service. Advanced alarm settings are available in the CloudWatch management console.

# How do GSI updates work?

If GSIs don't have enough write capacity, table writes will be throttled!

## LSI or GSI?

LSI can be modeled as a GSI

If data size in an item collection > 10 GB, use GSI

**If eventual consistency is okay for your scenario, use GSI!**

# DynamoDB Pricing & Free Tier

- Free Tier
  - ☐ 25GB of storage
  - ☐ 25 Reads per second
  - ☐ 25 Writes per second
- Pricing for additional usage in US East (N. Virginia)
  - ☐ \$0.25 per GB per month
  - ☐ Write throughput: \$0.0065 per hour for every 10 units of Write Capacity
  - ☐ Read throughput: \$0.0065 per hour for every 50 units of Read Capacity
